ZEPF Drop-Control

Blade Holder – Patent No. 102014 101 658

The **ZEPF Drop-Control®** Blade Holder is available in three diameters. This allows the user to choose according to his taste.

These instruments provide additional safety in daily surgical use when changing the blade. Pressing the slider triggers a mechanism that lifts the blade, pushes the blade further forward in its actuation path and thus finally, safely and in a controlled manner, ejects it into a sharps collection container. Afterwards, the ejector mechanism moves back to its initial position. This allows the blade to be changed safely, quickly and in a time-saving manner during treatment.

- Reduction of the risk of infection due to a contaminated blade thanks to safe ejection function
- Time saving when changing the blade during treatment
- No additional instrument required to remove the blade

**Controlled
dropping of
the blade**
